Abstract (en)

[origin: US4481392A] In order to boil eggs or other foods not suitable for cooking with direct microwave radiation, a receptacle containing such foods is separated from a microwave source by a radiation shield while an adjacent heating vessel partly filled with water is exposed to the microwaves. This vaporizes the water and the resulting steam is admitted into the receptacle for a rapid heating of its contents. The shield may adjoin the vessel walls and may reflect the incident microwaves into the water bath. In a simple case, the food receptacle and its shield may be replaced by a metal foil-e.g. of aluminum-in which the foods to be boiled are loosely wrapped while lying in a shallow pool of water within the microwave-irradiated heating vessel.
