Abstract (en)
[origin: EP0059249A2] 1. A radiation outlet window for an acceleration device, consisting of a metal mounting (12; 22; 32) made of an iron or copper material, and a foil (11; 21; 31) made of another material having a substantially smaller atomic number, which window seals the acceleration chamber, which is under a high vacuum, from the outer atmosphere in a high-vacuum tight manner, characterised in that the foil (11; 21; 31) is connected to the metal mounting (12; 22; 32) on one side by one, or on both sides by two, intermediate pieces (13, 14; 23, 24; 33) so as to be high-vacuum tight ; and that the intermediate pieces (13, 14; 23, 24; 33) and the foil (11; 21; 31) consist of identical or similar materials and are connected to one another by fusion welding.
