Abstract (en)  
[origin: EP0059768A1] 1. Gutter (10) consisting of a preferably arched base element (16) and arms (23, 25) extending therefrom with arm sections (18, 20) for receiving the lateral edges of ceiling elements (12, 14) which are preferably suitable for shielding load-bearing ceilings against rising fumes and the deposition of particles contained therein and which have a curve between the lateral edges and for conducting away the condensate deposited on the ceiling elements, the marginal regions of the gutter (10) being spaced apart from the marginal regions of the ceiling elements (12, 14), characterised in that the outer sections (22, 24) of the arms of the gutter (10) extend at least partly along the curve of the ceiling elements (12, 14) to form a flat channel between the surfaces of said arms and the facing sections of the ceiling element curves.
