Abstract (en)
[origin: EP0059964A2] The cutting device for installation in furniture, e.g. kitchen furniture such as fitted kitchens, has for example an electric cutting machine, such as a bread slicing machine, which can be moved out of a storage position in a cabinet into a position of readiness outside the cabinet. The intention in the case of such cutting devices is to allow the cutting machine to be brought from the storage position into the operating position and vice versa by simple handling. According to the invention, this is achieved essentially in that the cutting machine is arranged on a horizontally extensible shelf so as to be swivellable about a horizontal axis and is connected fixedly in terms of rotation to a swivel axle which is constructed as a spindle, extends in the direction of extension and interacts with a spinning element which is fixed in relation to the cabinet.
