Abstract (en)

Color photographic paper in which the backing has a polyolefin foil at the surface coated with the light-sensitive emulsion. The foil can be stripped from the rest of the backing by applying a force of 6-10 grams per centimeter width. The conventional cyan, magenta, and yellow strata of the photoemulsion can be imaged, adhered to any desired substrate, and a portion of the backing stripped cleanly away, leaving a reversed colored image protectively covered by the polyolefin foil. The cyan emulsion layer, normally outermost, is now innermost, where it is protected against UV-induced fading by the UV-absorbing interlayers conventionally interposed between the cyan-magenta and magenta-yellow emulsion strata.
