Abstract (en)

The support comprises a platform 1 to which are fixed two arms 2 for sustaining the rear fork of a bicycle with the back wheel thereof raised with respect to the platform 1. To the latter are also fixed two rubber faced rollers, or cylinders, 9, that rotate idly around inter-parallel spindles 10, the position of which can be adjusted with respect to the platform 1, the said rollers 9 being designed to grip, one opposite the other, the sides of the rim of the back wheel of the bicycle in such a way as to brake the free rotation of the said wheel.
