Abstract (en)

[origin: WO8201198A1] A mixture of stannic and chloride ions having a chloride to tin ratio of at least 4: 1 (e.g., stannic anion complexes) is provided to the cathode compartment (11) of an electrolysis cell (12) in which the anode (10) and cathode (11) compartments are separated by a cationic perm-selective membrane (13). The anolyte (16) is a mineral acid or tin salt thereof. Operation of the electrolysis cell (12) results in the production of stannous anion complexes which may be treated to obtain stannous chloride products.
