Abstract (en)

A device for detacking tobacco leaves or parts thereof from a flexible, belt-shaped carrier (1) retaining said leaves, wherein said belt-shaped carrier is led over a supporting face (4) having a relatively narrow, gap-shaped opening (7), a guiding member (12) is arranged behind said opening with respect to the supporting face (4) for the carrier (1), said device further comprising means for passing the carrier over the supporting face and via the guide member through the gap forward and backward, whereupon the tobacco material will be drawn loose at the gap and be further conveyed without deformation at a further place of the belt because the leaf material bridges the gap.
