Abstract (en)
[origin: EP0061996A2] A device for the suspension of a curtain (16) consists of a meandering holding tape (1) made of flexible material which brings about even folding. Arranged on the holding tape (1) are approximately vertical bushes (3) which serve for receiving the suspension devices (2). The suspension devices (2) consist of an approximately disc-shaped curtain slider (4) which is provided integrally with a bolt (5). The bolt (5) and bushes (3) are provided with a coupling mechanism (6) in such a way that the suspension devices (2) can be connected non-positively to the holding tape (1) by insertion. This enables particularly rapid preparation and mounting of the curtains. Additionally, the production costs are greatly reduced due to the particular design of the suspension devices (2). <IMAGE>
