Abstract (en)
In a four-cycle combustion engine of the type having plurality of intake valves and of exhaust valves provided each cylinder, at least an additional intermediate intake valve (5 min) is arranged in order to enlarge the number of intake valves. Said intermediate intake valve is arranged to face the combustion chamber of the cylinder at a smaller angle (alpha 1) of inclination with respect to the axis (I 1) of the cylinder than that of the remaining intake valves (5) which are arranged at both sides of said intermediate intake valve. As a result, any interference between said valves can be avoided.
