Abstract (en)
[origin: EP0063541A2] A window (2) is intended to be insulated against heat and sound in both directions by means of a roller blind. For this purpose, a blind track (1), which is wound on a fixed roller (4) and whose other end is fastened to a carrier (3), is drawn downwards and tautened by a movable roller (5) suspended therein, with the result that two layers (6, 7) having an intermediate air cushion are formed. The curtain track (1) consists at least partially of plastic film designed to be reflective, so that it reflects solar radiation to the outside or thermal radiation to the inside. The layers (6, 7) can be made of various materials. A lateral sealing using a magnetic tape may be provided. <IMAGE>
