Abstract (en)  
[origin: EP0063667A1] 1. Display stand for a jewellery article, such as a wrist watch, ring or necklace, for supporting said article in a position raised from a plane surface, and comprising a resilient band (2, 18, 23) intended to be applied against the internal face of the article (4, 15) to be displayed, in the desired position thereof, so as to serve as a support for the latter, said band (2, 18, 23) being provided with a small plate (1, 20, 21) capable of carrying data relative to the displayed article (4, 15) and serving as a support for holding the displayed article (4, 15) in the desired raised position, characterized in that said band (2, 18, 23) is made of a flexible material and in that the display stand, in the situation where it does not receive an article, is in a rest position, in which position the band is flat, and in that the band, owing to its flexibility, may be configured by the user out of said rest position in order to, on the one hand, apply against the internal face of the article and, on the other hand, hold same in the desired position of display via the small plate, whereby means, in particular the article itself, are acting against the elastic forces which tend to urge back the band into its rest position.
