Abstract (en)
[origin: EP0063722A2] In the manufacture of multiple packagings, it is advantageous to produce a uniform pack size in order to be able to work efficiently. However, this does not usually meet the wishes of the manufacturers and the consumers. A method is therefore proposed by means of which relatively large packagings are manufactured to be divided up into the particular desired size at the end of the production process. This is done by equipping the packaging sleeve with a perforated line along which the packaging can be separated. The packaging sleeve has a cover side with which it bears on the packaged articles, and two side walls. The apparatus has two rotatably mounted levers in a first station which permit the perforated lines in the two side walls to be broken open, and, in a second station, has two abutments as well as a pressure-transmitting element, which together permit the cover side of the jacket to be broken open along the perforated line there. <IMAGE>
