Abstract (en)

[origin: EP0064254A2] 1. Fastening device for a plaster-carrying means in the form of a reinforcing lattice (1) comprising intersecting running wires (2) and cross-wires (3) with an elongated support element (5) which is on the reinforcing lattice (1) on the side remote from the mounting wall (9) and which passes over a plurality of lattice wires (3) and which is connected to the supporting back-ground by means of at least one fastening bolt (6) extending through the reinforcing lattice, characterized in that the support element is a strip (5) with a U-shaped section open in the direction of insertion of the fastening bolts (6), the strip being provided along its periphery with recesses (7, 12, 13) of which the spacings are the same as the spacings between the cross-wires (3) of the reinforcing lattice (1).
