Abstract (en)
[origin: WO8201660A1] The toy with parachute has two arms (26) forming grip, hinged to a head (2) and on which acts a spring (3) to cause the spacing of the arms. At the lower end of each arm there is hinged a large panel (28) on which acts the air pressure and to which are fixed the ties (64) of the parachute. The panels have extensions (29) extending upwardly and engaging, in the closed position of the grip, with a corresponding portion (24a) of the arms. The head is carried by a support above the grip. To use the toy, the parachute is arranged inside the grip maintained in a closed position. Then the toy is thrown in the air. The air pressure acting on the panels prevents the opening of the grip or clip by the spring until the highest point of the trajectory is reached. Then the clip opens due to the action of the spring and the parachute opens out by the spacing of the arms and of the panels.
