Abstract (en)
The invention relates to stagings as would be used in conjunction with scaffolding to provide a load bearing work platform or walk way. Conventionally, stagings are formed by placing loose boards across oppositely disposed scaffold members, a laborious, time-consuming exercise requiring great care to ensure correct location of boards. Even with correctly located boards there is inevitable risk of movement of the boards during use with the resultant danger to operatives. The objective of the invention is to avoid such problems and the objective is met by the provision of a staging side member 1 having an elongate tubelike portion 2 to which is secured an open channel section 3 for the reception of staging boards or the like 4. Thus, a staging would comprise two such side members built into a scaffold structure with staging boards or the like extending across the side members and engaging in the respective recesses.
