Abstract (en)

[origin: EP0066732A2] The apparatus for expanding and flanging tubes comprises a screw closure (9) to retain the tube (7) to be worked. The actual retaining device consists of two half-jaws (17) with an outer circumference of more than 180 DEG in each case. The interior diameters of these halves (17) are each adapted to the exterior diameter of the tube (7) to be worked, and are fixed by means of a bayonet closure in two members (4, 5) which can be moved away from and towards each other. A simple mandrel-like tool (13), which is equipped with one or more rollers (16) for the flanging, is sufficient for the operation of expansion. When the retaining device is not closed, a shackle (18) blocks the introduction of the tool (13). A commercial hand drill which can be moved along a guide (14) serves as a drive for the tool (13). <IMAGE>
