Abstract (en)

[origin: US4429521A] A device for SZ-stranding, which includes a tube store mounted in a frame for rotation on its axis, at least one stranding disk associated with the tube store and a device for rotating said tube and disk in a reversing fashion characterized by a tubular sleeve being concentrically disposed on a portion of the tube store and being mounted in the device to rotate at a speed different than the speed of rotation for the tube store. The tubular sleeve can be disposed either adjacent the input which is usually defined by a guide disk or adjacent to the exit and the stranding disk. In one embodiment, two tubular sleeves are provided with one being adjacent the entrance and the guide disk and the other being connected to rotate with the stranding disk at a speed different than the speed of rotation for the tube store.

Abstract (de)

Die Erfindung betrifft eine Vorrichtung zum SZ-Verseilen mittels einer Verseilscheibe (VS), bei der die Verseilelemente längs der Oberfläche eines reversierend angetriebenen und als Führungs- und Speicherkörper dienenden Rohrspeichers (RO) geführt werden. Es ist eine sich nur über einen Teil des Rohrspeichers (RO) erstreckende Hülse (HL) vorgesehen, welche so gelagert ist, dass sie die Bewegungen des Rohrspeichers (RO) nicht mitmacht. Dadurch lässt sich die Schlagkonzentration gezielt dämpfen.
