Abstract (en)

The cable (1), in particular for the power supply and/or control of mobile user appliances in general, is of the type comprising a flexible sheath of flat configuration, a plurality of electrical conductors (2-6) disposed side-by-side along a common plane lying between and parallel to the opposing major faces (8, 8 min) of said sheath, and continuous longitudinal mechanical elements (7, 7 min) resistant to axial traction, and is essentially characterised in that said sheath is constituted by a central flat portion (9) comprising first upper and lower faces and second lateral faces, and of a material which is flexible but highly compression-resistant, for housing at least said electrical conductors; an outer covering (10) of elastic material for said central portion; and at least one transverse armouring reinforcement (11, 11 min) disposed between said central portion and said outer covering.
