Abstract (en)

[origin: WO8202235A1] A graded planar seal is provided between opposing planar surfaces (62, 64) for isolating an air bearing in a vacuum environment (16). The air bearing (22, 24, 26, 62, 64) supports a structure (20) such as a semiconductor mask or wafer and functions in a vacuum environment without severely degrading the quality of the vacuum. The air bearing is isolated from the vacuum by the use of the graded planar seal which establishes a pressure gradient from the level of the air which supports the air bearing (22, 24, 26, 62, 64) to the level of the vacuum environment (16). The gradient is established across the seal by evacuating gas through successive orifices (42, 44, 46, 52) in opposing planar members (12, 14).
