Abstract (en)
A servo system (11) includes a servo control circuit (12a, 12b) adapted to control the flow of pressurised fluid to a hydraulic control jack (15), the control circuit including a main spool valve (25), a break-out valve (40) operative in the event of a failure of the spool valve (25) and in response to a subsequent movement of control means (13) to connect a source of pressurised fluid to operate a by-pass valve (31) to open a circuit between the chambers (15a, 15b) of the jack. Preferably the break-out valve (40) includes isolating means (42, 43, 44, 48) adapted to isolate the valve from subsequent movements of the control means (13).
