Abstract (en)
The tambourine comprises a frame (1) and a metal ring (3) associated thereto and effective to take over the stresses created by the tambourine membrane (2) in such a way as to prevent the frame from deforming due to additional stresses acting thereon during the playing. Thus, owing to the presence of the reinforcing metal ring (3), there are obviated both twisting and out-of-round problems in the tambourine frame (1) and, in addition, the center of gravity of the tambourine is brought closer to the membrane thereby improving stability and controllability as the ball is hit.
