Abstract (en)  
[origin: EP0069593A2] A process for polymerizing a monomer capable of forming, upon polymerization in a reaction medium which is liquid under the reaction conditions, a polymer solution having an upper cloud point, the polymerization being carried out under such conditions that the resulting polymer dissolves in the reaction medium; wherein (i) the polymerization is carried out in a polymerization zone (A) at a temperature above the upper cloud point of said polymer solution and under conditions which enable the polymer solution to be separated into two phases, (ii) the polymerization is carried out under stirring conditions which maintain the two phases under said phase-separating conditions in a dispersed and mixed state, and (iii) the resulting solution is sent to a separating zone (B) located independently of said polymerization zone (A), separating it into two phases in the separating zone (B) at a temperature above the upper cloud point, and thereafter recovering a polymer-rich liquid phase as a lower layer (C) while recycling a polymer-lean liquid phase as an upper layer to the polymerization zone (A).
