Abstract (en)

A device for use during epidermic and depth treatments on the human body as well as during post-operative care, consisting of a couch (1) on which a box-like covering and continuous structure (4) is fitted so as to provide a closed space equipped with temperature conditioning means (9) adapted to the requirements of the human body, which device can be used on areas of the body which are bare or not covered by blankets. The inner space is limited by a transversally arranged curtain (4) hung at the upper end (6) of the inside of the structure, the bottom of which rests on the surface of the couch, against the lower end of the pillow. In this way, the patient will have his head exposed, whilst the rest of the body will be contained in the temperature-controlled space.
