Abstract (en)

[origin: EP0069947A2] The barrel filling device having a spout (4) that is to be extended into a barrel from a rest position, and having a conical gasket (5) which takes over the sealing function with respect to the barrel during the filling process, is to be provided with means for disinfecting all the areas of the components that come into contact with the charge and with the ambient air. The solution is characterised by an enveloping tube (7), which surrounds the spout (4) at a distance and has feed and exhaust lines (10, 11) for disinfecting solution that are assigned to the annular space (8) between the spout and enveloping tube (Fig. 1). <IMAGE>
