Abstract (en)

[origin: US4451740A] Device for determining the power output of a turbo-group during disturbances in the electricity supply network, the working-medium pressures at the beginning and the end of all turbine-sections being utilized, from the time the disturbance breaks out, throughout its duration, and until the signal oscillations die away, in order to generate a signal representing the instantaneous power output of the turbo-group, this signal being employed to implement the regulating function during the disturbance.
