Abstract (en)
[origin: EP0071208A2] The rotary potentiometer has a supporting plate (1) on which is located an inner annular wiper path and an outer horseshoe-shaped resistor path. The terminal ends (4, 5) of the wiper path and of the resistor path are arranged at a side edge of the supporting plate (1). The wiper contacts (6) are adjustable by means of a driver (7) with a control element (14). Such a potentiometer is intended on the one hand to be able to be fitted simply without riveting processes and in addition to be easily connectable to the control element (14). For this purpose the driver (7) has a rotating shaft (13) which is connected to the periphery of the driver (7) via a radial web (9), such that the rotating shaft (8) can be moved axially. The free end of the rotating shaft (8) directed towards the supporting plate (1) is split by a longitudinal slot (10) into a rotatable notch connection. This is supported in a central hole (11) of the supporting plate (1). The other free end (13) of the rotating shaft (8) can be coupled to the control element (14). <IMAGE>
