Abstract (en)
[origin: EP0072333A1] 1. A method of constructing a rigid solid panel by juxtaposing and securing a number of coplanar filling elements (1a, 1b, 1c) having a cross-section in the form of a flattened U and each having a flat web (2), two flanges turned towards the inner face of the web, and two flange bends (4) facing the inner surface of the filling element, a recess (6) being formed on at least one of the outer surfaces of the flanges of the element, the method being characterised in that a deformable sealing material (9) is disposed between two adjacent flanges (3a, 3b) of two adjacent filling elements (1a, 1b) which material is compressed between the two flanges (3a, 3b) of the adjacent filling elements by bringing the flanges together so that the material at least partly fills the recess (6) without spreading to the outer surface of the panel.
