Abstract (en)

[origin: EP0072776A1] 1. Spacer for fixing an upper reinforcement (23) via supports in reinforced plane load-bearing structures to be concreted, such as walls and/or girders, which consists of two longitudinal bars (11, 12) bent identically in meander form and retained at a distance from one another by transverse bars (13), the transverse bars (13) projecting beyond the longitudinal bar (12) by the same lengths (14) at least on one side of the spacer basket, characterised in that the distance (D) between the longitudinal bars (11, 12), as measured on the outside, is approximately equal to the extent (F), as measured on the outside, of the meander-shaped bending of the longitudinal bars (11, 12), plus the thickness of the transverse bars (13).
