Abstract (en)
[origin: WO8202941A1] The security device, particularly intended to guns, comprises two slides (7, 8) movable into guides perpendicularly to the longitudinal axis of the chamber (15) and arranged in parallel inside the trigger device of the weapon. The slides (7, 8) are interconnected by means of a double arm lever (9) so that a descending motion of one of the slides causes the rising of the other slide and vice versa. The lower portion of at least one (8) of the slides protrudes inside (3) the trigger guard (2). One (7) of the slides is arranged so as to lock, in a secured position, the trigger member (6) associated to the trigger (4), and to engage a recess (16a) of the striker (16) by its upper end (7a) through an orifice (15a) of the wall of the chamber. The other slide (8) is arranged so that, in an unsecured position, it forms a stop, by its upper end, for a neighbouring stop ring of the front end of the chamber.
