Abstract (en)
[origin: WO8201961A1] The fuse comprises an elongated support formed by at least partially ferrite, magnetised in the direction of its thickness and on which there is arranged, between two terminals, a metal wire (9) capable of being destroyed by fusion. The fuse comprises for example two ferrite strips (5 and 6) assembled and maintained in a spaced relationship by two insulating material bars (7 and 8), a silver wire (9) being arranged between the two strips. During fusion of the wire, the melting metal and the electric arc are expelled sideways according to Laplace law.
