Abstract (en)  
[origin: WO8300706A1] The stamped knitting tool, for example a spring needle or a sliding needle, a latch needle or a plush needle or similar, has a hook formed on the collar of a rod, which is formed continuously and up to the end of the hook or up to the beginning of the hook point with a substantially rectangular cross-section profile. In order to make the hook (5) able to withstand the high biasing forces due to the knitting, without any danger of premature breaking or bending of the hook or any other damages, while providing the hook with reduced dimensions, said hook (5) is formed with a cross-section having a maximum thickness (3) close to the collar (4), and which decreases continuously up to the end of the hook or up to the beginning of the point (9).
