Abstract (en)

[origin: EP0073438A2] The apparatus has a front part or a trough (1) and a rear or shovel part (2). The latter can be swivelled about an axle (3) by a hydraulic piston-cylinder unit (24). The axle (3) passes through the ends of a strut (18) and second supports (20). By the swivel movement about this axle, the apparatus can be brought into an opened position in which, when it is dragged along, the front edge (14) of the shovel part (2) is pulled through the snow and the layer of snow located above the front edge is conveyed into the shovel part (2). When the latter has been filled, the apparatus can be closed again. At the discharge site, in addition to the piston-cylinder unit (24) actuating the shovel part, a further unit (32), arranged between the drawbar (4) and the trough (1) can be actuated, the extended piston rod of which brings the trough (1) into an oblique discharge position. <IMAGE>
