Abstract (en)

[origin: WO8203164A1] In view of the prior existence of a removable cover, connected to a single or double bed, that contains the air (PI 8101697, of March 19, 1981), the "Warm circulating air ambient for beds" includes a supply of air for this ambient, which is warmer than the air in the rest of the room, with a constant regulation of the temperature by the use of a small heating apparatus controlled by thermostat(s). This kind of heating must be used with the "uncovered head" model.
