Abstract (en)

[origin: EP0074821A2] A wooden tile which is preferably used for floor covering is formed by a number of individual members (1) which may be bonded (2) together. The wooden tile is made by knife cutting a sheet of wood from a piece of timber and then cutting the individual members from the wooden sheet. Adhesive such as Ureaformaldehyde is applied to the edges of the members to bond them together. The tile so formed is flexible, durable and economic to manufacture.
