Abstract (en)
[origin: EP0076425A2] The invention relates to a mast/boom connection, particularly for surf boards, having two sleeves which are fixedly connected to each other and arranged in a V formation, and can be pushed onto the ends of the two spars of the boom to connect them fixedly, and having a retaining device fixedly attached to the two sleeves for connecting the boom to the mast in the form of a locking member arranged between the mutually opposing surfaces of the two sleeves. This locking member possesses a bearing slot into which can be inserted a retaining pin attached to the mast, and a clamping member which is provided with a plug and can be rotated by hand, the plug whereof constricts the bearing slot, in at least one position of rotation, to such an extent that the retaining pin is secured against unintentional release from the locking member. The locking member, which possesses a handle-like element, can easily be rotated by hand from the locked into the unlocked position and vice versa, as a result of which the bearing slot and hence the boom can either be lifted slightly away from the head of the retaining pin or locked against such lifting.
