Abstract (en)
[origin: EP0077873A1] 1. A lightweight building panel for improving the ease of walking on uneven floors, the panel comprising a yielding base body (14) of polymeric material and a reinforcing insert or underlay (6) of a resilient material, which supports the base body over its entire surface, characterised in that the reinforcing insert or underlay (6) is of such dimensions and is so matched to the resilient properties of the base body (14) that the sag of a 0,5 m wide strip under a uniformly distributed surface load of 300 N/m**2 is at least 10 mm if the support points are 1 m apart and at most 1,0 mm if the support points are 0.5 m apart.
