Abstract (en)
[origin: EP0079873A1] A cabinet door, door, shelf end-piece or the like, comprises a closed frame (1) with an interchangeable insert or filler, and with edge grooves for holding thin peripheral edge portions of an insert. To make after-insertion and removal of inserts with raised portions (15) possible, the insert is divided into a plurality of sections (12, 13) along at least one dividing line, which when the insert is in place, is oriented essentially transverse to the longitudinal axis of one of the frame members (3) which has a groove opening into the outer edge surface of said frame member (3), at least one of said sections containing the raised portion (15) of the insert, while at least one other section of the same forms an essentially flat member (13) which can be inserted through the groove which opens into said outer edge surface to complete and fix the insert in the frame.
