Abstract (en)
[origin: WO8204203A1] A package (10) for the metered dispensing of a liquid product which eliminates degradation of the product due to contact with air. The package consists of a sealed pressurized container (12) for the liquid product and a dispensing pump (14) mounted on the container. The pump includes a housing (18), a hollow stem (67) defining an induction passage (68) at the bottom of the housing, a piston (36) slidably mounted in the housing and a valve (54) slidably positioned over hollow stem (67) and biased upwardly against the piston. The piston is provided with an extension (44) defining a discharge passage (56); the extension carries an actuator (16) provided with a discharge orifice (64). Upon downward movement of the piston, liquid in the housing will be pressurized, and when sufficient hydraulic pressure is attained, valve (54) will move downwardly with respect to the piston to effect opening of discharge passage (56) and allow discharge of liquid from discharge orifice (64).
