Abstract (en)

[origin: EP0080087A1] 1. An apparatus for preventing the outflow of impurities, more especially slag, together with molten material, more especially metal, from a casting aperture (22), which is provided with a melting plate (25), of a container for the reception of molten material, the melting plate (25) being insertable into the casting aperture (22) and being melttable within a predetermined period by the molten material which is subsequently introduced into the container, characterised in that the melting plate (25) is provided with a predetermined melting point (26) which reduces its thickness and which is melted prior to the rest of the melting plate (25) by the molten material in the container and which, in the state in which it has melted through, has a section of passage for molten material which is substantially smaller than that of the molten melting plate (25).
