Abstract (en)

A boxing is suggested for concrete buildings which comprises, as a structural skeleton of the building to be erected, a supporting structure for conventional wood panels to close the boxing. The supporting structure, to be composed and assembled at the building yard, is composed by assemblable and interchangeable members of bent stamped sheet metal (23), shaped and perforated, and on such members there are removably secured the wood panels (20) which are then held united together by appropriate tie bars (27). In erection, the supporting structure, composed of uprights and the horizontal structural set (24) is first assembled, by preparing beforehand the openings for the doors and windows. In the hollow spaces within the walls there are positioned all the appliances (37) for each kind of service which is desired, whereafter the boxing is closed by the wood panels (20) and the concrete mixture is poured into the boxing.
