Abstract (en)

[origin: EP0080424A1] 1. An equipment for the treatment of textiles by a wet process with a variable volume of bath, suitable for operation both with a long bath and with a short bath, of the type comprising a transport pipe (2) and a treatment chamber (3) running essentially in a horizontal longitudinal direction, the pipe (2) and chamber (3) together forming a channel that is closed in on itself in which the circulation of the fabric, in the form of an endless tube, is ensured by the actual circulation of the treatment bath, characterized in that the equipment (1) is suitable for tilting relatively to the horizontal so as to reduce the actual treatment zone of the treatment chamber and to reduce the tension on the fabric when the bath ratio diminishes.
