Abstract (en)
[origin: EP0082064A2] 1. A manostat comprising a case having, on the one hand, a rear securing surface (5) opposite and parallel to a front surface (13) borne by a closing lid, and having, on the other hand, a median plane (PP') parallel to two walls which are separated by a small width with respect to the height and which contains : an axis of movement (XX') of a movable control member (10) belonging to a pressure detection device (9), an axis of rotation (YY') of a setting member (15, 15') which operates a pressure balancing spring (14) which is located in the median plane (PP') and connected to the control member (10), an axis (ZZ') of movement of the pusher (18) of a switch (19) operated by a motion transmitting lever (17) which moves in said median plane (PP'), an axis (VV') of a pressure orifice (25) coaxial to the axis of movement (XX') and the axis (SS') of an electric connection aperture (27), these axes being mutually parallel and parallel to the securing surface (5), this orifice (25) and this aperture (27) being located on the same connection surface (24) perpendicular to the median plane (PP') and to the securing surface (5), characterized in that the securing surface (5) is perpendicular to the median plane (PP'), whereas the front surface (13) has a display member (22) moving parallel to the axis of movement (XX') and in that the balancing spring (14), together with a coaxial setting member (15) accessible on said front surface, are located in a region (12) opposite the connection surface (24), the axis of rotation (YY') of said setting member being perpendicular to said securing surface (5).
