Abstract (en)
[origin: WO8300047A1] An improved biomedical analysis tray (10) for use in electromagnetic radiation-beam instrumental or visual analysis of multiple samples. The tray includes a planar upper plate (12) including ninety-six circular apertures (16) arrayed therethrough in eight rows and twelve columns. A sample well (18) depends from each aperture. Each well (18) has a right cylindrical segment (22), a truncated conical segment (24), and a circular flat bottom panel (20). The upper plate (12) is supported by support walls (14) of sufficient height to maintain the bottom of the sample wells (18) in free suspension. The tray (10) is constructed of a radiation rigid material transparent to the analysis radiation and which is impervious to the reagents and organic agents utilized in the desired analyses.
