Abstract (en)
[origin: WO8300280A1] The thermal insulation device for windows, doors and the like is provided as a curtain (10) or a roller blind. As a carrier element, it comprises a synthetic sheet covered with at least one metal layer deposited by vaporization or spraying and having a high reflection power for large wavelength thermal radiation. The synthetic sheet is divided at least locally for example by means of perforations (11) or by addition of narrow strips (15, 16) with a view to modify its mechanical characteristics to decrease the elasticity. The structure thus obtained, which may be used as curtains or roller blinds, is aesthetic and constitutes an important improvement.
