Abstract (en)

[origin: US4522424A] The ski binding clamp mechanism includes a base plate 5 which is to be attached to a ski 1, as well as a clamping unit 7 which is guided in lengthwise displaceable manner along the ski. A locking arrangement 15 latches the clamping unit 7 to the base plate 5 in predetermined displacement positions. The locking arrangement 15 has a locking member 21 movably attached to the clamping unit 7 and is held by a spring 17 in mating engagement with a complementary locking member 23 of base plate 5. A double arm lever 27, pivotally attached to the clamping unit 7 and having an operating arm 33 and a disengaging arm 35, disengages the locking arrangement 15 against the resistance of spring 17. The disengaging arm 35 is substantially shorter than the operating arm 33 in order to facilitate the disengaging action. A locking projection 41 prevents undesired disengagement of the locking arrangement 15 when lever 27 is latched in the operating position of the ski binding clamping mechanism. When the locking arrangement 15 is disengaged, the locking projection 41 prevents the lever from being moved back into its rest position.
