Abstract (en)
[origin: US4452036A] The bracelet is constituted by members of general U shape (1 to 5), with the same internal profile, engaged in staggered manner one in the other, the sides (2a,5a) comprising, on their inner face, a groove (6a,7b) together defining a passage for a pin (10) of corresponding shape, in particular circular shape. The clearance (13,18) between two adjacent members of the same row is less than the necessary movement of the members perpendicular to the pins for releasing it from the pin and from the associated member. Means such as a head or stud are provided for retaining the members transversely with respect to the bracelet. The members may be of uniform thickness, the grooves being formed by the curvature of the sides of these members.
