Abstract (en)  
1. A guarding device for a wood planing machine with a movable guard bridge (6) disposed above the table (2) of the planing machine and permitting the portion of the tool-shaft (3) located in front of the work-piece guide to be covered, means being provided for adjusting the height of the bridge (6), to permit the passage of the wood to be planed, and to permit it to move vertically whilst remaining parallel to the table (2), the guard bridge (6) being supported by an element (7) having a substantially vertical rectilinear guide (4, 5) characterised in that the rectilinear guide (4, 5) is effective along a single vertical axis and in order to immobilise the guard bridge to prevent it from rotating, is combined with a supporting mechanism by at least two levers (8, 11) located in the same vertical plane and connected together by at least one intermediate articulation shaft (10), one lever (8) being articulated by a movable shaft (9) to the supporting element (7) of the guard bridge (6) and another lever (11) being articulated by a fixed shaft (12) to a support (1) rigid with the frame of the planing machine, the guard bridge (6) being moved automatically upwards to a pre-adjusted height, under the effect of return means (13).

Abstract (fr)  
L'invention concerne un dispositif monté sur une dégauchisseuse à bois et permettant de couvrir la partie de l'arbre porte-outils (3) située à l'avant du guide-pièce. Le dispositif comprend un pont protecteur mobile (6) situé au-dessus de la table (2) de la dégauchisseuse et pouvant se déplacer verticalement en restant parallèle à la table (2). Selon l'invention, le guidage de ce déplacement est assuré par une colonne verticale (5) qui coulisse dans un guide (4) appartenant à un support (1) fixé au bâti de la machine, un guidage complémentaire étant permis par au moins deux leviers (8, 11) dont l'un est articulé à l'ensemble mobile colonne(5) - pont (6) et dont l'autre est articulé au support (1). Un levier (11) coopère avec une came-butée (14) solidaire d'un levier de manoeuvre (16) pour le réglage en hauteur du pont (6), qui est rappelé vers le haut par un ressort (13).
