Abstract (en)

The present invention relates to a bushing for gas-insulated electrical equipment, and consists in a bushing wherein a conductor (1) penetrates through a porcelain tube (7,8) which has a fitting flange (5) connected to one end thereof and wherein main electrodes (3) concentric with the conductor (1) are interposed between layers of an insulating member (2) which insulates an outer periphery of the conductor, wherein an end part of said each main electrode (3) closer to the other end of said porcelain tube (8) is exposed a predetermined length from said insulating member, and wherein annular auxiliary electrode means (12) are electrically connected with said main electrode (3) and the external shape of which having a curved surface is arranged at the exposed end part of said main electrode (3), whereby electric fields near the end part of said main electrode (3) are moderated so as to enhance the dielectric strength of the bushing.
