Abstract (en)

[origin: EP0086524A2] Squeeze rolls (10, 11) for sheet materials fed continuously between said rolls, in which: considering a traditional position in which the rolls (10, 11) are tangential along a straight line lying in the plane defined by the axes (y, z) of the two rolls, one of the two rolls is rotated about an axis (x) lying in said plane, in a position corresponding with the central section of the roll in order that the rolls (10, 11) become tangential at only one point (14), situated on said axis (x) of rotation, whereas the theoretical straight lines (12, 13) which in the traditional position define the line of tangency where they mate, now define a plane (p) orthogonal to said axis (x) of rotation.
